

Patient Agreement to Systemic Therapy: Consent Form	
Cabozantinib	
Patient's details / addressograph:	<input type="checkbox"/> Male <input type="checkbox"/> Female
	Special requirements (e.g. other language/other communication method)
	Consultant:

Name of proposed course of treatment:**Cabozantinib**

Tablets taken by mouth once daily continuously, until disease progression

CRUK/Macmillan leaflet given

Statement of health professional (to be filled in by health professional with appropriate knowledge of proposed procedure, as specified in consent policy)

- I have discussed what the treatment is likely to involve (including inpatient / outpatient treatment, timing of the treatment, follow-up appointments) and location.

The intended benefits

- Curative – to give you the best possible chance of being cured
- Palliative – the aim is not to cure but to control or shrink the disease. The aim is to improve both quality of life and survival
- Adjuvant – therapy given after surgery to reduce the risk of recurrence of cancer
- Neo-adjuvant – therapy given before surgery or radiotherapy to shrink the cancer

Significant, unavoidable or frequently occurring risks:

Common side-effects: tiredness and feeling weak, feeling sick (nausea) or being sick (vomiting), loss of appetite, hand/foot skin reaction (redness of the palms of your hands or soles of your feet, sore or swollen hands or feet), high blood pressure, protein in your urine, diarrhoea or constipation, sore mouth and ulcers, effects on the skin (rash, redness, dryness or itching), thyroid problems (symptoms of an underactive thyroid may include tiredness, weight gain, constipation, aches, feeling cold, dry skin and hair), headache, a hoarse voice

Less common but potentially life threatening side-effects: gastro-intestinal perforation, severe bleeding events

Other less common side-effects include: rarely, cases of reversible encephalopathy with seizures, headache, altered mental status and visual disturbances have been reported.

Cancer can increase your risk of developing a blood clot (thrombosis), and cabozantinib may increase this risk further. A blood clot may cause pain, redness and swelling in a leg, or breathlessness and chest pain - you must tell your doctor straight away if you have any of these symptoms.

Cabozantinib may have an effect on fertility.

I have warned the patient that there is an unknown risk of cabozantinib affecting fertility (in men and in women)

Cabozantinib may damage the development of a baby in the womb (foetus), leading to the many risks associated with an abnormal pregnancy. Therefore, I have discussed the issues of protected sex. This is an issue for both men and women. The patient has been advised not to become pregnant / not to get a partner pregnant during the period of treatment and for at least 4 months after completing treatment.

Any other risks:
